

### Key Features

Mixed convection and radiation It is a cylindrical heater placed at the top of the duct. The temperature can be measured in a different angle position by releasing the screw and rotating the thermocouple with a heating adjustment of 100 watts at 24 volts. Airflow can be introduced into the duct using the fan, whose flow rate can be controlled using the auxiliary control knob. The heater temperature can be adjusted using a potentiometer. The measurement of different parameters such as temperature, voltage, current, airflow rate, etc., can be read from two digital panels by changing the selection switch.
